## The Real Leadership Lessons of Steve Jobs

21/25,2pt

His saga is the entrepreneurial creation myth writ large: Steve Jobs cofounded Apple in his parents' garage in 1976, was ousted in 1985, returned to rescue it from near bankruptcy in 1997, and by the time he died, in October 2011, had built it into the world's most valuable company. Along the way he helped to transform seven industries: personal computing, animated movies, music, phones, tablet computing, retail stores, and digital publishing. He thus belongs in the pantheon of America's great innovators, along with Thomas Edison, Henry Ford, and Walt Disney. None of these men was saint, but long after their personalities are forgotten, history will remember how they applied imagination to tech and business.

14/16,8pt

### Simplify

Jobs's Zenlike ability to focus was accompanied by the related instinct to simplify things by zeroing in on their essence and eliminating unnecessary components. "Simplicity is the ultimate sophistication," declared Apple's first marketing brochure. To see what that means, compare any Apple software with, say, Microsoft Word, which keeps getting uglier and more cluttered with nonintuitive navigational ribbons and intrusive features. It is a reminder of the glory of Apple's quest for simplicity.

Jobs learned to admire simplicity when he was working the night shift at Atari as a college dropout. Atari's games came with no manual and needed to be uncomplicated enough that a stoned freshman could figure them out. The only instructions for its Star Trek game were: "1. Insert quarter. 2. Avoid Klingons." His love of simplicity in design was refined at design conferences he attended at the Aspen Institute in the late 1970s on a campus built in the Bauhaus style, which emphasized clean lines and functional design devoid of frills or distractions.

When Jobs visited Xerox's Palo Alto Research Center and saw the plans for a computer that had a graphical user interface and a mouse, he set about making the design both more intuitive (his team enabled the user to drag and drop documents and folders on a virtual desktop) and simpler. For example, the Xerox mouse had three buttons and cost 300 Dollar; Jobs went to a local industrial design firm and told one of its founders, Dean Hovey, that he wanted a simple, single-button model that cost 15 Dollar.

Hovey complied.

# Bend Reality

Jobs's (in)famous ability to push people to do the impossible was dubbed by colleagues his Reality Distortion Field, after an episode of Star Trek in which aliens create a convincing alternative reality through sheer mental force. An early example was when Jobs was on the night shift at Atari and pushed Steve Wozniak to create a game called Breakout. Woz said it would take months, but Jobs stared at him and insisted he could do it in four days. Woz knew that was impossible, but he ended up doing it.

14/16,8pt

Those who did not know Jobs interpreted the Reality Distortion Field as a euphemism for bullying and lying. But those who worked with him admitted that the trait, infuriating as it might be, led them to perform extraordinary feats. Because Jobs felt that life's ordinary rules didn't apply to him, he could inspire his team to change the course of computer history with a small fraction of the resources that Xerox or IBM had. "It was a self-fulfilling distortion," recalls Debi Coleman, a member of the original Mac team who won an award one year for being the employee who best stood up to Jobs. "You did the impossible because you didn't realize it was impossible."

One day Jobs marched into the cubicle of Larry Kenyon, the engineer who was working on the Macintosh operating system, and complained that it was taking too long to boot up. Kenyon started to explain why reducing the boot-up time wasn't possible, but Jobs cut him off. "If it would save a person's life, could you find a way to shave 10 seconds off the boot time?" he asked. Kenyon allowed that he probably could. Jobs went to a whiteboard and showed that if five million people were using the Mac and it took 10 seconds extra to turn it on every day, that added up to 300 million or so hours a year—the equivalent of at least 100 lifetimes a year. After a few weeks Kenyon had the machine booting up 28 seconds faster.

11/13,2pt

Shortened essay about Walter Isaacson, who describes the 14 imperatives behind Jobs's approach: focus; simplify; take responsibility end to end; when behind, leapfrog; put products before profits; don't be a slave to focus groups; bend reality; impute; push for perfection; know both the big picture and the details; tolerate only "A" players; engage face-to-face; combine the humanities with the sciences; and "stay hungry, stay foolish."

no stress at all,  
perfect circles

The diagram shows the word "Eleme" in a bold, sans-serif typeface. It is positioned between two horizontal lines: the top line (x-height) and the bottom line (baseline). A third line (cap height) is also present. Annotations with blue dots and leader lines point to specific features: the top of the 'l' in 'Ele' (ascender), the top of the 'e' in 'Ele' (cap height), the top of the 'e' in 'eme' (x-height), the top of the 'e' in 'eme' (cap height), and the top of the 'e' in 'eme' (x-height). The word is written in a dark grey color.
